### SUSTAINED RELEASE MATRIX COMPOSITION

The present invention relates to sustained release pharmaceutical microparticle compositions in particular sustained release pharmaceutical microparticle compositions including an active ingredient of very low solubility in water, and to a method of preparing same.

As is known in the prior art it is desirable in the treatment of a number of diseases both therapeutically and prophylactically to provide the active pharmaceutical ingredient in а sustained release form. particularly desirable for the treatment of diseases which have to be treated for prolonged periods such as, for example, hypertension. In these instances it is desirable to minimize the frequency of intake of medicaments. is not only more pleasant for the patient it also increases the reliability of treatment by diminishing the disadvantages of irregular intakes and results in a more nearly constant therapeutic level of active ingredient in the body. Further this minimizes the risks of the active blood levels not being within the required therapeutic indices and avoids blood level peaks usually found after intake of rapid release forms.

Whilst there is known in the prior art numerous sustained release formulations the extension of such sustained release regimen to active pharmaceutical ingredients of very low solubility in water has been extremely limited.

For example, active ingredients of very low solubility include the dihydropyridine compounds which are used as cardiovascular agents. Difficulties often occur in the pharmaceutical formulation of these potent active compounds due to their very low solubility, which can result in erratic and/or poor absorption of the drug from pharmaceutical dosage forms.

One such technique of enhancing drug absorption is to formulate a solid dispersion or co-precipitate system. This technique is well known and is extensively discussed in the article "Pharmaceutical Applications of Solid Dispersion Systems" by Win Loung Chiou and Sidney

WO 94/05262 PCT/AU93/00462

Riegelman. J. of Pharm. Sci. Vol. 60, No. 9, September 1971 (1281-1301) which is incorporated herein by reference.

The term Solid Dispersion or Co-Precipitate refers to the dispersion of one or more active ingredients in an inert carrier or matrix at solid state prepared by the melting (fusion), solvent, or melting-solvent method and is hereinafter simply referred to as a "matrix". Solid dispersions may also be called solid-state dispersions. The dispersion of a drug or drugs in a solid diluent or diluents by traditional mechanical mixing is not included in this definition.

Whilst numerous attempts have been made to prepare sustained release forms of pharmaceutical formulations including dihydropyridine compounds as the active ingredient, it has not been possible to date to formulate a matrix composition in microparticle form which in use will release such active ingredients at a sufficient rate to provide a therapeutic level of active for extended periods of time, preferably for at least approximately 12 hours or more, preferably 24 hours or more.

Accordingly it is an object of the present invention to overcome, or at least alleviate, one or more of the difficulties related to the prior art.

Accordingly in a first aspect of the present invention there is provided a sustained release matrix pharmaceutical microparticle composition including

a core element including

an active ingredient of very low solubility;
and

at least two polymers in a matrix therewith; and optionally

an enteric coating over the core element.

By the term "matrix" as used herein we mean that the active ingredient is in a solid dispersion or co-precipiate with a polymer.

By the term "microparticle composition" as used herein we mean pellets or granules. Preferably the microparticle composition is in the form of pellets.

By "sustained release" as used herein we mean at

- 3 -

least a two fold reduction in dosing frequency as compared to drug presented as a conventional dosage form (e.g. as a solution or a prompt drug-releasing, conventional dosage form). [U.S. Pharmacopeia [USPXXI](1985)(xivi)]. e.g. for at least approximately 12 hours or greater, preferably for at least approximately 24 hours.

By "active ingredient of very low solubility" as used herein we mean pharmaceutically active, orally acceptable ingredients having an aqueous solubility of approximately 1 in 10<sup>3</sup> parts of solvent per part of solute or less, preferably at least approximately 1 in 10<sup>4</sup> parts of solvent per part of solute or less.

10

15

20

25

30

35

By "bioavailability" as used herein we mean the extent to which the active drug ingredient is absorbed from the microparticle composition and which reaches the general circulation intact.

The active ingredient of very low solubility may be selected from the group consisting of dihydropyridines for example Nifedipine, Nitrendipine, Nisoldipine, Nimodipine, Nicardipine, Darodipine, Isradipine, Niludipine, Amlodipine, Felodipine, Lacidipine, BBR-2160, Cronidipine, Diperdine, Mepirodipine, Nilvadipine, Oxodipine, Sangandipine, Clinidipine, Manidipine, Benidipine, pharmaceutically acceptable isomers and salts thereof and mixtures thereof. The active ingredient in the final composition is preferably in crystalline form.

The active ingredient may be present in the core element in any suitable effective amount. The amount of active ingredient is dependent on the potency of the active ingredient and on the desired dosage strength and volume of a unit dose of the drug product. The active ingredient may be present in amounts of approximately 0.1 to 99%, preferably 1 to 95% by weight, based on the total weight of the core element. The active ingredient may preferably be a dihydropyridine compound, more preferably nifedipine. The compound nifedipine may be present in amounts of approximately 5 to 70% by weight, preferably 15 to 50% by weight, based on the total weight of the core element.

In the following description the active ingredient

WO 94/05262

5

10

25

.30

35

of very low solubility will be illustrated by reference to dihydropyridine, nifedipine. However this illustrative only and the invention is in no way restricted thereto.ic Nifedipine is a cardiovascular drug and is a potent relaxant of arterial smooth muscle. It dilates both the main coronary arteries and arterials both in normal and in ischaemic myocardioregions. is also a potent inhibitor of coronary artery spasm. Nifedipine is thus indicated in the long-term management of angina pectoris due to coronary heart disease. The usual dose is one 10 mg capsule three times daily but up to two capsules four times daily may be taken. benefits of a sustained release microparticle composition including nifedipine are thus obvious.

15 The polymeric component of the sustained release matrix pharmaceutical composition may include, in addition to the active ingredient,

- polymer which is at least partially water-soluble (water-soluble polymer); and
- 20 a polymer which is substantially insoluble at acidic pH but at least partially soluble at a less acidic to basic pH (enteric polymer).

The water-soluble polymer may be selected from the group consisting of polyvinyl pyrrolidone, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyethylene alcohol glycol, polyvinyl mixtures and Polyethylene glycols or Macrogols of intermediate molecular weights (4000-12000) have been found to be suitable. The polyethylene glycol sold under the trade designation PEG 6000 has been found to be suitable.

The water-soluble polymer may be present in the core element in amounts of from approximately 10 to 80%, preferably 15 to 60% by weight, based on the total weight of the core element.

The enteric polymer, when present, may be selected from the group consisting of cellulose acetate phthalate, hydroxypropyl methylcellulose phthalate polyvinyl acetate phthalate, methacrylic acid copolymer, hydroxypropyl methylcellulose acetate succinate, shellac,

30

35

cellulose acetate trimellitate and mixtures thereof. Particularly preferred enteric polymers include synthetic or semi-synthetic resins bearing carboxyl groups. The hydroxypropyl methylcellulose phthalates sold under the trade designations HP50 or HP55 have been found to be suitable.

The enteric polymer may be present in the core element in an amount of from 0 to approximately 50% by weight, preferably 0.1 to 20% by weight, more preferably 0.5 to 10% by weight, based on the total weight of the core element.

Accordingly, in a preferred aspect of the invention there is provided a sustained release pharmaceutical microparticle composition including

15 a core element including

approximately 1 to approximately 95% by weight based on the total weight of the core element of a pharmaceutically active ingredient of very low solubility; and

approximately 5 to approximately 99% by weight of a polymeric component in a matrix therewith including

a water-soluble polymer; and an enteric polymer;

and optionally

an enteric coating over the core element.

The core element may further include other compounding ingredients including plasticisers and fillers. Accordingly, in a preferred aspect, the core element may further include

0 to approximately 20% by weight, preferably 5 to 10% by weight, based on the total weight of the core element of a plasticiser selected from the group consisting of diethyl phthalate, triethyl citrate, triethyl acetyl citrate, triacetin, tributyl citrate, glycerol or mixtures thereof; optionally

0 to approximately 50% by weight, preferably 5 to 30% by weight, based on the total weight of the core element of a filler selected from the group consisting of

10

15

20

25

30

35

insoluble materials such as silicon dioxide, titanium dioxide, talc, alumina, starch, kaolin, polacrilin potassium, powdered cellulose, and microcrystalline cellulose and mixtures thereof; and optionally

0 to approximately 50% by weight, preferably 5 to 10% by weight, of a water-insoluble polymer selected from suitable pharmaceutically acceptable substantially insoluble independent of pH. The polymer selected from the group consisting ethylcellulose, acrylic and/or methacrylic ester polymers or mixtures thereof and the like may be used. Polymers or copolymers of acrylates or methacrylates having a low quaternary ammonium content may be used. The acrylic acid ethyl ester: methacrylic acid ester (1:1) copolymer has been found to be suitable.

In a still further preferred aspect the core element may further include 0 to approximately 20% by weight, preferably 1 to 10% by weight of at least one selected from surfactant docusate sodium lecithin, polyoxethylene, sorbitan fatty acids (e.g. tweens) and sorbitan esters (e.g. spans). The surfactant sold under the trade designation Cremaphore RH410 has been found to be suitable.

In a preferred aspect of the present invention the the pharmaceutical element of microparticle composition according to the present invention may include a core seed.

The size and amount of the core seed may vary substantially from approximately 100µm to 1700µm depending upon the amount of active ingredient to be Accordingly, the core seeds may vary from included. approximately 5 to 99% by weight, preferably 10 to 70% by weight based on the total weight of the core element, depending on the potency of the active ingredient. The core seed may be of such a diameter to provide a final core element having a diameter of approximately 200 to 2000 µm.

The core seed may be of any suitable type. A sugar sphere or an active core seed may be used. The core element may further include other carriers or excipients,

20

stabilizing agents and colorants.

Where the matrix pharmaceutical microparticle composition includes an enteric coating on the core element, the enteric coating may be formed from an enteric polymer as described above. A hydroxypropyl methyl cellulose phthalate coating such as that sold under the trade designation HP50 or HP55 has been found to be suitable.

The enteric coating may further include a 10 plasticiser.

Accordingly in a preferred aspect the enteric coating may include

approximately 40 to 100% by weight, preferably 70 to 95% by weight, based on the total weight of the enteric coating, of at least one enteric polymer,

0 to approximately 30% by weight, preferably 5 to 10% by weight, based on the total weight of the enteric coating of at least one plasticiser selected from diethyl phthalate, triethyl citrate, triethyl acetyl citrate, triacetin, tributyl citrate, dibutyl sebacate and glycerol.

The enteric coating may comprise from approximately 2 to 20% by weight, preferably approximately 4 to 10% by weight, of the pharmaceutical microcapsule composition.

In a preferred form the pharmaceutical 25 microparticle composition may have the following formulation

Percentage ranges for the components of the pharmaceutical microparticle composition (percentages W/W):

| · · · · · · · · · · · · · · · · · · · | Preferred Range<br>% w/w | More Preferred<br>Range % w/w |

The core element may comprise a single or a

10

plurality of core layers.

In a preferred aspect of the invention, the core element comprises a single layer.

Accordingly in the preferred aspect of the invention there is provided a sustained release matrix pharmaceutical microparticle composition including

a core element comprising a single layer including approximately 1 to approximately 95% by weight based on the core element of a pharmaceutically active ingredient of very low solubility; and

approximately 5 to approximately 99% by weight of a polymeric component in a matrix therewith including

at least one water-soluble polymer; and at least one enteric polymer;

and optionally

an enteric coating over the core element.

In a further preferred form the pharmaceutical 20 microparticle composition may have the following formulation:

Percentage ranges for the components of the pharmaceutical microparticle composition (percentages W/W):

|                  | Preferred Range<br>% w/w | More Preferred<br>Range % w/w |

In an alternative preferred aspect of the invention, the core element comprises a plurality of core layers.

Accordingly in an alternative preferred aspect of the invention there is provided a sustained release pharmaceutical microparticle composition including

- 9 -

5

10

15

20

25

30

35

a core element including a plurality of core layers, wherein the core element includes

> approximately 1 to approximately 95% by weight based on the total weight of the core element of a pharmaceutically active ingredient of very low solublity; and

> approximately 5 to approximately 99% weight based on the total weight of the core element of a polymeric component in a matrix therewith,

> wherein at least one core layer includes a water-soluble polymer: and an enteric polymer in a matrix therewith; and optionally

an enteric coating over the core element.

Preferably where the core element comprises a plurality of core layers, the outer core layer of the core element comprises the two polymers in matrix therewith.

The pharmaceutically active ingredient may be present in the outer core layer in any suitable effective amount. The amount of active ingredient is dependent on the potency of the active ingredient and on the desired dosage strength and volume of a unit dose of the drug The active ingredient may be present in amounts product. of approximately 0.1 to 95% by weight, based on the total weight of the outer core layer. The active ingredient may preferably be a dihydropyridine compound. The compound may be present in amounts of approximately 5 to 70% by weight, preferably 10 to 60% by weight, based on the total weight of the outer core layer.

The water-soluble polymer may be selected from the list of previously polymers as described. The polyethylene glycol sold under the trade designation PEG 6000 has been found to be suitable.

The water-soluble polymer may be present in the outer core layer in amounts of from approximately 10 to 80%, preferably 15 to 60% by weight, more preferably 30 to 50% by weight, based on the total weight of the outer core layer.

WO 94/05262 PCT/AU93/00462

**- 10** -

The enteric polymer may be selected from the list of polymers previously described. The hydroxypropyl methyl cellulose phthalates sold under the trade designation HP50 or HP55 have been found to be suitable.

The enteric polymer may be present in the outer core layer in an amount of up to approximately 50% by weight, preferably 1 to 20% by weight, more preferably 2 to 15% by weight, based on the total weight of the outer core layer.

10 Accordingly, in a preferred aspect of the present invention there is provided a sustained release matrix pharmaceutical microparticle composition including a core element including

approximately 1 to 95% by weight based on the 15 total weight of the core element of a dihydropyridine compound;

a core seed;

5

20

25

30

35

approximately 20 to 90% by weight based on the total weight of the inner core layer of a water-soluble polymer in a matrix therewith; and

approximately 30 to 80% by weight based on the total weight of the outer core layer, of a water-soluble polymer; and

approximately 2 to 20% by weight based on the total weight of the outer core layer, of an enteric polymer in a matrix therewith,

and optionally an enteric coating over the core element.

As described above the pharmaceutical microparticle composition may include a plurality of core layers. The composition of the core layers may differ in the concentration or nature of the active ingredients therein. For example use of active ingredients of differing crystal size in adjacent layers is preferred. This may extend the period of sustained release even further.

The inner layer and outer core layer of the core element may be present in any suitable amounts in the pharmaceutical microparticle composition. The inner core layer (including sugar seeds where present) may comprise from approximately 40 to 95% by weight, preferably 50 to

25

30

35

- 11 -

85% weight, of the pharmaceutical microparticle The outer core layer may comprise from approximately 5 to 60% by weight, preferably 15 to 50% by weight, of the pharmaceutical microparticle composition.

Accordingly, the pharmaceutical microcapsule composition may have the following formula:

|  | CORE ELEMENT |                        |                        | CORE COATING     |             |

The components of the core element other than the core seed, when present, may be provided in the form of a solution, dispersion or suspension.

In the form of a solution, the solvent or solvents may be present in amounts of from approximately 25 to 97% by weight, preferably 85 to 97% by weight, based on the total weight of the core formulation. The solvent for the core formulation may be a solvent such as methanol, ethanol, methylene chloride, acetone, isopropanol mixtures thereof. Methanol, methylene chloride or a mixture thereof is preferred.

In a further aspect of the present invention, there is provided a method for preparing a sustained release pharmaceutical microparticle composition providing

- a core seed;
- a core formulation including
  - an active ingredient of very low solubility;
  - at least two polymers capable of forming a

- 12 -

matrix with the active ingredient; and a solvent therefor;

introducing the core seed into a fluidised bed coater, a centrifugal granulator or spheronizer; and

spraying the core formulation onto the core seed to form a matrix core element; and

drying the core element.

The core seed may include a sugar sphere. active ingredient may be a dihydropyridine compound, preferably nifedipine.

Where a plurality of core layers are to be used the method may further include

providing

a core layer formulation including

at least one active ingredient of very 15 low solubility;

> polymers including a least two water-soluble polymer; and optionally

> > an enteric polymer; and

20

25

30

10

a solvent therefor;

introducing the core seed into a fluidised bed coater, a centrifugal granulator or spheronizer; and

spraying successive layers onto the core seed to form the matrix core element wherein at least one layer includes the core layer formulation.

Where an enteric coating is to be used, the method may further include

providing

sustained release pharmaceutical microparticle; and

an enteric coating formulation including an enteric polymer; optionally

a plasticiser; and

a solvent therefor.

introducing the microparticle into a fluidised bed coater, a centrifugal granulator or spheronizer; and

spraying the enteric coating formulation onto the microparticle to form a sustained release microcapsule.

The sustained release core element and sustained

- 13 -

release microcapsules may be subjected to a drying step. The drying step may be conducted in a fluidised bed or drying oven.

Spray coating of core elements may be undertaken utilizing bottom or Wurster, top or tangentially located spray nozzles. A bottom spray nozzle may reside proximate to the base of the fluidised bed facing upwards while a top spraying nozzle is located above the contents of the bed and facing downwards. The spray nozzle may reside in the mid-section of the fluidised bed and be oriented such as to spray tangentially to the rotating core elements.

The sustained release matrix pharmaceutical microparticle composition according to the present invention may include a plurality of microparticles.

15 The sustained release pharmaceutical composition may be provided in any suitable unit dosage form. encapsulated form may be used. The pharmaceutical microparticle composition may be provided in a pellet or tabletted pellet form. A tablet may be formed 20 compression of the pellets optionally with the addition of suitable excipients.

The sustained release pharmaceutical microparticle composition may be in multi-pellet encapsulated, sprinkle, sachet or tabletted forms.

The sustained release pharmaceutical microparticle composition may be administered under a similar dosage regimen to that used in the prior art. However, it is preferred that the pellet composition be administered less frequently. The multi-pellet encapsulated form may for example be administered once every 12 hours, preferably once every 24 hours.

In a preferred aspect of the present invention the release pharmaceutical pellet composition incorporating the dihydropyridine compound may provide effective vasodilation with once daily administration. Versatility of dosing may be achieved with 20 to 90 mg or any other dose strength of capsules required.

In accordance with a further aspect of the present invention, there is provided a method of treating

10

15

20

25

cardiovascular related conditions in patients requiring such treatment which method includes administering to a patient an effective amount of a sustained release pharmaceutical microparticle composition including

a core element including a dihydropyridine; and at least two polymers in a matrix therewith; and optionally

an enteric coating over the core element.

The method of treatment according to this aspect of the present invention is particularly applicable to the treatment of Hypertension and/or Angina pectoris due to coronary heart disease, particularly Angina pectoris related to coronary artery spasm, utilising for example nifedipine.

Preferably the sustained release pharmaceutical microparticle composition is provided in a unit dosage form and administration occurs at intervals of approximately 12 to 24 hours.

The present invention will now be more fully described with reference to the accompanying examples. It should be understood, however, that the following description is illustrative only and should not be taken in any way as a restriction on the generality of the invention specified above.

### PROCESS FOR EXAMPLES 1 TO 4 (CORE MANUFACTURE)

To a Fuji Paudal Q400 spheroniser for Examples 1 and 4 or Glatt WSGl for Examples 2, 3 and 5 the sugar spheres are charged. A dissolved solution containing nifedipine PEG 6000 and HP50 (or PVAP, for Example 4) in a mixture of methanol/methylene chloride (50/50) was applied as atomised droplets onto the sugar spheres. The finished cores are dried for 15 minutes at 40°C.

30 Finished cores are between  $600-850\mu m$  with potency of 28% and yield of 1075g.

## PROCESS FOR EXAMPLE 6 AND 7 (CORE MANUFACTURE)

35

To a Fuji Paudal Q400 spheroniser the sugar spheres are charged. A dissolved solution containing the nifedipine, PEG 6000 and mixture of methanol/methylene chloride (50/50) was applied as atomised droplets onto the sugar spheres. The finished inner cores are dried at 40°C for 15 minutes. This batch is returned to commence the second stage or second layer. To this charge a dissolved

solution containing the nifedipine, PEG 6000 and HP50 in the methanol/methylene chloride mixture was supplied as atomised droplets onto the inner cores. The finished cores are dried at 40°C for 15 minutes.

#### 5 ENTERIC COATING OF CORES

The cores produced from Example 6 was enteric coated using the following process.

To the Glatt WSG/1, 1.6 kg of cores were charged. A dissolved solution containing 117.6 g HP50, 13g of diethyl phthalate in 1.96 kg of ethanol/water mixture was applied as atomised droplets to the fluidising cores. On completion of the spray, the pellets were dried for 50 minutes at an inlet air temperature of 41°C. The weight gain was recorded as 5.8% w/w.

#### 15 IN-VITRO TESTING

10

20

25

30.

35

In vitro dissolution profiles were generated at pH 6.8 for Examples 1 to 7 above utilising the following test method dissolution.

Each formulation included 60 mg equivalent nifedipine and was dissolved in 900 mL at pH of 6.8 with surfactant and an orthophosphate buffer. The apparatus used is baskets. Sampling is carried out using a 0.45 µm filter and samples were determined using UV spectrophotometer at a wavelength of 340 nm.

The results are provided in Figures 1 to 7.

### IN VIVO TESTING

Mean nifedipine concentrations were generated in vivo utilising Example 6 above. These were compared with comparison formulations A and B (see below).

A three way single dose cross over pilot study was performed to assess the bioequivalence of the nifedipine formulations, including batches of Example 6, comparison A and comparison B (reference). Eighteen healthy male subjects received a single 60 mg dose of a formulation after an overnight fast. At the end of the study, each subject had received two formulations (out of a possible 4) and the reference formulation (B). Plasma samples from all subjects were analysed for nifedipine using a validated chromatographic procedure.

WO 94/05262 PCT/AU93/00462

- 19 -

Comparison A is not in accordance with the invention and comprises an uncoated core where micronised nifedipine is layered onto sugar spheres.

The formulation comprises

| COMPARISON A                | ₽W\W  |
|-----------------------------|-------|
| ifedipine                   | 31.85 |
| ydroxypropyl Cellulose      | 4.14  |
| Polyoxyethylene 20 sorbitan | 0.32  |
| Sugar spheres 20/25 mesh    | 63.69 |

It does not contain a matrix composition, and as can be evidenced by the high initial plasma peak, does not produce a suitable sustained release profile.

Comparison B is the existing commercially available sustained release product Procardia XL, 60 mg extended release tablets by Pfizer.

The results are provided in Figure 8.

Finally, it is to be understood that various other modifications and/or alterations may be made without departing from the spirit of the present invention as outlined herein.

#### Claims

20

25

1. A sustained release pharmaceutical microparticle composition including

a core element including

an active ingredient of very low solubility;

at least two polymers in a matrix therewith; and optionally

an enteric coating over the core element.

- 2. A microparticle composition according to claim 1, wherein the polymer components include
  - a polymer which is at least partially
    water-soluble (water-soluble polymer); and
- a polymer which is substantially insoluble at 15 acidic pH but at least partially soluble at a less acidic to basic pH (enteric polymer).
  - 3. A microparticle composition according to claim 2, wherein

the water-soluble polymer is selected from the group consisting of polyvinyl pyrrolidone, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyethylene glycol, polyvinyl alcohol and mixtures thereof; and

the enteric polymer is selected from the group consisting of cellulose acetate phthalate, hydroxypropyl methylcellulose phthalate (HPMCP), polyvinyl acetate phthalate, methacrylic acid copolymer, hydroxypropyl methylcellulose acetate succinate, shellac, cellulose acetate trimellitate and mixtures thereof.

A microparticle composition according to claim 3,
 wherein

the water-soluble polymer is present in an amount of from approximately 10 to 80% by weight, based on the total weight of the core element; and

the enteric polymer is present in amounts from 35 0.1% to approximately 50% by weight, based on the total weight of the core element.

- 5. A microparticle composition according to claim 1 wherein the active ingredient includes a dihydropyridine.
- A microparticle composition according to claim 5

wherein the dihydropyridine is nifedipine.

- 21 -

5

20

25

30

35

7. A microparticle composition according to claim 1, further including

0 to approximately 50% by weight, based on the total weight of the core element of a plasticiser selected from the group consisting of diethyl phthalate, triethyl citrate, triethyl acetyl citrate, triacetin, tributyl citrate, glycerol, dibutyl sebacate or mixtures thereof; optionally

10 0 to approximately 50% by weight, based on the total weight of the core element of a filler selected from the group consisting of insoluble materials such as silicon dioxide, titanium dioxide, talc, alumina, starch, polacrilin potassium, powdered cellulose, microcrystalline cellulose and mixtures thereof; 15 and optionally

approximately 50% to by weight. water-insoluble polymer selected from the group consisting of ethyl cellulose, acrylic and/or methacrylic ester polymers or mixtures thereof.

- A microparticle composition according to claim 7 further including approximately 1 to 10% by weight based on the total weight of the core element, of a surfactant.
- A microparticle composition according to claim 1, 9. wherein the core element includes a core seed.
  - A sustained release pharmaceutical microparticle composition including

a core element including

approximately 1 to approximately 95% weight based on the total weight of the core element of a pharmaceutically active ingredient of very low solubility; and

approximately 5 to approximately 99% weight of a polymeric component in a matrix ... therewith including

> a water-soluble polymer; and an enteric polymer;

and optionally an enteric coating over the core element.

5

10

20

30

11. A sustained release pharmaceutical microparticle composition including

a core element including a plurality of core layers, wherein the core element includes

approximately 1 to approximate 95% by weight based on the total weight of the core element of a pharmaceutically active ingredient of very low solubility; and

approximately 5 to approximately 99% by weight based on the total weight of the core element of a polymeric component in a matrix therewith,

wherein at least one core layer includes a water-soluble polymer: and

an enteric polymer in a matrix therewith; and optionally

an enteric coating over the core element.

12. A sustained release matrix pharmaceutical microparticle composition including a core element including

approximately 1 to 95% by weight based on the total weight of the core element of a dihydropyridine compound;

a core seed;

approximately 20 to 90% by weight based on the total weight of the inner core layer of a water-soluble polymer in a matrix therewith; and

approximately 30 to 80% by weight based on the total weight of the outer core layer, of a water-soluble polymer; and

approximately 2 to 20% by weight based on the total weight of the outer core layer, of an enteric polymer in a matrix therewith,

and optionally an enteric coating over the core element.

- 35 13. A microcapsule composition including a microparticle composition according to claim 1, further including approximately 2 to 20% by weight of an enteric coating over the core element.
  - 14. A microcapsule composition according to claim 13,

wherein the enteric coating includes

approximately 40 to 100% by weight, based on the total weight of the enteric coating, of at least one enteric polymer,

- o to approximately 30% by weight, based on the total weight of the enteric coating of at least one plasticiser selected from diethyl phthalate, triethyl citrate, triethyl acetyl citrate, triacetin, tributyl citrate, dibutyl sebacate and glycerol.
- 10 15. A method for preparing a sustained release pharmaceutical microparticle composition providing
  - a core seed;
  - a core formulation including

an active ingredient of very low solubility; at least two polymers capable of forming a matrix with the active ingredient; and a solvent therefor;

introducing the core seed into a fluidised bed coater, a centrifugal granulator or spheronizer; and

- spraying the core formulation onto the core seed to form a matrix core element; and drying the core element.
  - 16. A method according to claim 15, further including providing
- 25 a core layer formulation including

an active ingredient of very low solubility;

at least two polymers including a water-soluble polymer; and optionally

an enteric polymer; and a solvent therefor;

introducing the core seed into a fluidised bed coater, a centrifugal granulator or spheronizer; and

- spraying successive layers onto the core seed to form the matrix core element wherein at least one layer includes the core formulation.
  - 17. A method according to claim 16 wherein the core element includes

approximately 1 to approximate 95% by weight

25

30

35

WO 94/05262 PCT/AU93/00462

based on the total weight of the core element of a pharmaceutically active ingredient of very low solubility; and

approximately 5 to approximately 99% by weight based on the total weight of the core element of a polymeric component in a matrix therewith.

wherein at least one core layer includes a water-soluble polymer: and

an enteric polymer in a matrix therewith; and optionally

an enteric coating over the core element.

- 18. A method according to claim 15, further including providing
- a sustained release pharmaceutical microparticle; and

an enteric coating formulation including an enteric polymer; optionally

a plasticiser; and

20 a solvent therefor

introducing the microparticle into a fluidised bed coater, a centrifugal granulator or spheronizer; and

spraying the enteric coating formulation onto the microparticle and then spraying an enteric coating formulation onto the core element to form a sustained release coated pellet.

19. A method according to claim 15 wherein

the water-soluble polymer is selected from the group consisting of polyvinyl pyrrolidone, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyethylene glycol, polyvinyl alcohol and mixtures thereof; and

the enteric polymer is selected from the group consisting of cellulose acetate phthalate, hydroxypropyl methylcellulose phthalate (HPMCP), polyvinyl acetate phthalate, methacrylic acid copolymer, hydroxypropyl methylcellulose acetate succinate, shellac, cellulose acetate trimellitate and mixtures thereof.

20. A method according to claim 19 wherein the water-soluble polymer is present in an amount

of from approximately 10 to 80% by weight, based on the total weight of the core element; and

the enteric polymer is present in amounts from 0.1% to approximately 50% by weight, based on the total weight of the core element.

- 21. A method according to claim 20 wherein the active ingredient includes a dihydropyridine.
- 22. A method according to claim 21 wherein the dihydropyridine is nifedipine.
- 10 23. A method of treating cardiovascular related conditions in patients requiring such treatment which method includes administering to a patient an effective amount of a sustained release pharmaceutical microparticle composition including
- a core element including a dihydropyridine; and at least two polymers in a matrix therewith; and optionally

an enteric coating over the core element.

- 24. A method according to claim 23 wherein the 20 microparticle composition is administered at intervals of approximately 24 hours or more.
  - 25. A method according to claim 23 wherein the dihydropyridine is nifedipine.
  - 26. A method according to claim 23 wherein
- the water-soluble polymer is selected from the group consisting of polyvinyl pyrrolidone, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyethylene glycol, polyvinyl alcohol and mixtures thereof; and
- the enteric polymer is selected from the group . 30 consisting of cellulose acetate phthalate, hydroxypropyl methylcellulose phthalate (HPMCP), polyvinyl phthalate, methacrylic aciđ copolymer, hydroxypropyl methylcellulose acetate succinate, shellac, cellulose acetate trimellitate and mixtures thereof.
  - 35 27. A method according to claim 23 wherein

the water-soluble polymer is present in an amount of from approximately 10 to 80% by weight, based on the total weight of the core element; and

the enteric polymer is present in amounts from

WO 94/05262 PCT/AU93/00462

- 26 -

0.1% to approximately 50% by weight, based on the total weight of the core element.

- 28. A method according to claim 23 wherein the microparticle composition includes
- a core element including a plurality of core layers, wherein the core element includes

approximately 1 to approximate 95% by weight based on the total weight of the core element of a dihydropyridine; and

approximately 5 to approximately 99% by weight based on the total weight of the core element of a polymeric component in a matrix therewith.

wherein at least one core layer includes

a water-soluble polymer: and

an enteric polymer in a matrix therewith; and optionally

an enteric coating over the core element.

- 29. A method according to claim 28 wherein the 20 dihydropyridine is nifedipine.
  - 30. A microparticle composition according to claim 1, wherein the composition is in a unit dosage form.
  - 31. A microparticle composition according to claim 30 wherein the composition is in a pellet or tabletted pellet form.
  - 32. A microparticle composition according to claim 1 wherein the active ingredient is in a crystalline form.
